ABSTRACT: The flavour of reconstituted orange juices differs from that of
freshly hand-squeezed orange juices that retain the ***pulp***. The
distribution of volatile compounds in the **pulp**, cloud and serum
of freshly squeezed ***orange*** ***juice*** was studied. Volatile
compounds were **extracted** with pentane-ether and analysed by
GC-MS. Monoterpene hydrocarbons were the main volatile group, followed
by sesquiterpene hydrocarbons. These were more abundant in the
pulp and cloud than in the freshly squeezed juice. Esters and
monoterpene alcohols were mainly found in the serum. The yield and
composition of alcohol-insoluble residues (AIRs) of cloud and
pulp were determined. No relationship was observed between the
retention of aroma compounds in the **pulp** or cloud and their AIR,
lipid content or composition.
